- What can be said about the isomorphism type?
- Given $g \in G$, write g as product of the M_i
(or in terms of some “nice” generating set of G).
- Do all this “efficiently”.

We call this “solving the word problem in G ”.

Example:

```
# input:
r := [ a, b, c ];
# program:
r[4] := r[1]^2*r[2]*r[1]^(-2);
r[5] := r[4]*r[3]^7;
# return values:
[ r[4], r[5]^5 ]
```

Efficiency

What does “efficiently” mean?

The maximal number of operations necessary is bounded by a (fixed) polynomial in the “input size”.

The input size is measured by

- d : size of matrices,
- k : number of matrices, and
- $\log(q)$: size of a field element.

Aschbacher's Theorem

Aschbacher classified the maximal subgroups of $GL_d(q)$.

Theorem (Aschbacher, 1984)

If $G < GL_d(q)$ then it falls under **at least one** of:

C1 G leaves invariant a subspace $0 < W < \mathbb{F}_q^{1 \times d}$

C2 G preserves a decomposition $\mathbb{F}_q^{1 \times d} \cong V_1 \oplus \cdots \oplus V_j$

...

C4 G preserves a decomposition $\mathbb{F}_q^{1 \times d} \cong V_1 \otimes V_2$

...

C8 G contains a "classical group" like $SL_d(q)$ or $Sp_d(q)$

C9 G is a quasi-simple group

- **documentation** of it
- a framework to administrate methods to find homomorphisms or leaves
- the infrastructure for **SLPs**, **matrix handling**, etc.
- background algorithms for **orbits**, **MEATAXE**, etc.
- handling of **permutation groups** in our framework
- homomorphisms using **invariant subspaces**
- a **low index procedure (without analysis)**
- methods to handle C1, C2, C4, and C6
- recognition of **classical groups** (C8)
- recognition of **simple groups** by the **two largest element orders** (C9)
- a start of a **database of hints** for recognised leaves

Max Neunhöffer

The Problem

Solving the word problem
Straight line programs
Efficiency
Discrete logarithm problem
History

Some Solutions

What one can do
The composition tree
An example: Low index
Aschbacher classes
Leaves

State of implementation

GAP package recog
Help is appreciated

Still missing:

- analysis of the low index procedure

Max Neunhöffer

Everybody is welcome to contribute.

We need **ideas**, **code**, and **analysis**.
