# Computing with remainders

For  $a, n \in \mathbb{Z}$  we can divide  $a$  with remainder by  $n$ :

$$a = q \cdot n + r, \quad \text{with } q, r \in \mathbb{Z},$$

such that  $0 \leq r < n$ .

$\implies q$  and  $r$  are uniquely determined.

We write

$$a \equiv b \pmod{n}$$

if  $a$  and  $b$  have the same remainder on division by  $n$ .

We say: “ $a$  is equal to  $b$  modulo  $n$ ”.

Same as: the difference  $a - b$  is divisible by  $n$ .

Note in particular:  $a \equiv r \pmod{n}$ .

## Note (Computation tricks)

If  $a \equiv \hat{a} \pmod{n}$  and  $b \equiv \hat{b} \pmod{n}$ , then

$$a + b \equiv \hat{a} + \hat{b} \pmod{n}$$

and

$$a \cdot b \equiv \hat{a} \cdot \hat{b} \pmod{n}$$

and thus

$$a^k \equiv \hat{a}^k \pmod{n}.$$

Can we compute  $123^{129}$  modulo 10 easily?

$$\begin{aligned} 123^{129} &\equiv 3^{129} \equiv 3^{1+128} \equiv 3 \cdot 3^{(2^7)} \pmod{10} \\ &\equiv 3 \cdot (((((((3^2)^2)^2)^2)^2)^2)^2 \pmod{10} \\ &\equiv 3 \cdot ((((((9^2)^2)^2)^2)^2)^2 \pmod{10} \\ &\equiv 3 \cdot (((((1^2)^2)^2)^2)^2 \equiv 3 \pmod{10} \end{aligned}$$

# Fermat and Euclid

## Theorem (Little Theorem of Fermat)

Let  $n = p \cdot q$  be the *product of two primes  $p$  and  $q$* . Then

$$a^{(p-1)(q-1)} \equiv 1 \pmod{n}$$

for all integers  $a$  *that are not divisible by  $p$  or  $q$* .

From this we get immediately:

For  $k \equiv 1 \pmod{(p-1)(q-1)}$  we have

$$a^k \equiv a \pmod{n},$$

as  $a^k \equiv a^{x \cdot (p-1)(q-1) + 1} \equiv (a^{(p-1)(q-1)})^x \cdot a \equiv a \pmod{n}$ .

## Theorem (Euclidean Algorithm)

If  $d, m \in \mathbb{Z}$  *do not have a common prime divisor*, then it is *(efficiently) possible* to determine an  $e \in \mathbb{Z}$ , such that  $de \equiv 1 \pmod{m}$ .

## The RSA (Rivest-Shamir-Adleman) cryptosystem:

If Alice wants to send a secret message to Bob:

- Bob chooses two primes  $p$  and  $q$
- and computes  $n = p \cdot q$  and  $m = (p - 1)(q - 1)$ .
- He then chooses  $d$  such that  $m$  and  $d$  do not have a common prime divisor
- and computes an  $e$ , such that  $de \equiv 1 \pmod{m}$ .
- He then publishes  $n$  and  $e$
- and keeps secret  $p$ ,  $q$ ,  $m$  and  $d$ .

# Encrypting and Decrypting

**Public:**  $n$  and  $e$       **Secret:**  $p, q, m = (p-1)(q-1)$  and  $d$

Alice can now **encrypt** a message:

- **Encode** the message as numbers  $a$  with  $1 < a < n$ .
- **Compute** encrypted message  $c$  by

$$c \equiv a^e \pmod{n} \quad \text{with } 1 \leq c < n$$

- **Send**  $c$  to Bob.

Bob can then **decrypt** the message:

- Receiving  $c$ , he **computes**  $b$  by

$$b \equiv c^d \pmod{n} \quad \text{with } 1 \leq b < n$$

- He gets back  $b \equiv c^d \equiv (a^e)^d \equiv a^{de} \equiv a \pmod{n}$   
since  $de \equiv 1 \pmod{(p-1)(q-1)}$ .

**Public:**  $n$  and  $e$      **Secret:**  $p, q, m = (p - 1)(q - 1)$  and  $d$

If one knows  $p$  and  $q$ , one **can compute**  $m$  and  $d$ .

If one knows  $m = (p - 1)(q - 1)$ , then also  $p$  and  $q$ .

**Proof:**  $p + q = n + 1 - (pq - p - q + 1)$     and  
 $(X - p)(X - q) = X^2 - (p + q)X + pq$

Knowing  $n$  **in principle** determines  $p$  and  $q$ !

However, **actually computing**  $p$  and  $q$  from  $n$  is **HARD**.

# Computing roots and discrete logarithm

**Public:**  $n$  and  $e$       **Secret:**  $p, q, m = (p-1)(q-1)$  and  $d$

Cracking the encryption is basically solving the equation

$$x^e \equiv c \pmod{n}$$

that is, **computing  $e$ -th roots**.

However, **computing  $e$ -th roots** is **HARD**.

- **Assume**  $1 < z < n$  such that **every**  $a$  is a power of  $z$  modulo  $n$  (**not always possible!**).
- **Compute**  $w \equiv z^e \pmod{n}$  with  $1 < w < n$ .
- **Solve**  $c \equiv w^x$  ("**discrete logarithm**").
- **Then**  $a \equiv z^x \pmod{n}$  since

$$a \equiv c^d \equiv w^{dx} \equiv (z^e)^{dx} \equiv (z^{ed})^x \equiv z^x \pmod{n}$$

However, **solving discrete logarithms** like  $c = z^x$  is **HARD**.

Not proved!

# Not proved!

There is  
no efficient method known  
for  
integer factorisation  
or  
computing  $e$ -th roots  
or  
discrete logarithms!

However: It is also not proved, that there is none!.
