Finding Unavoidable Sets

The Result

Symmetry Breaking

We “break the symmetry” by considering **exactly one from each equivalence class**. Consider only first block row:

- 1 We can **renumber** to get this left hand 3×3 -block:

1	2	3	4	6	8	9	5	7
4	5	6	9	1	7	8	3	2
7	8	9	3	5	2	1	4	6

Algorithm: Finding Unavoidable Sets

Definition: Unavoidable Set

Let S be a filled Sudoku grid. A subset U of the 81 positions is called an **unavoidable set**, if **every** set of clues **uniquely defining** S has a number in at least one of the positions in U .

That is: If we leave out the numbers in the positions U , there is more than one solution.

Algorithm: Start with a full grid.

- 1 Leave out a number in a **random position**.
- 2 Solve Sudoku, if solution still **unique**, go to step 1.
- 3 Try to put back each number to **ensure minimality**.

Algorithm: Finding Unavoidable Sets

Definition: Unavoidable Set

Let S be a filled Sudoku grid. A subset U of the 81 positions is called an **unavoidable set**, if **every** set of clues **uniquely defining** S has a number in at least one of the positions in U .

That is: If we leave out the numbers in the positions U , there is more than one solution.

Algorithm: Start with a full grid.

- 1 Leave out a number in a **random position**.
- 2 Solve Sudoku, if solution still **unique**, go to step 1.
- 3 Try to put back each number to **ensure minimality**.

Improvement: Whenever our candidate set C contains an already known unavoidable set U , we remove U from C .
