- One non-trivial group element is returned.
- The algorithm is Monte Carlo and could return a wrong result.

# Examples

This approach works well in many important cases:

$G$	$N$	time
$A_{20} \wr A_{30}$	$A_5^{\times 30}$	120
$SL(3, 3) \wr A_{10} < GL(30, 3)$	$SL(3, 3)^{\times 10}$	724
$Sp(6, 3) \otimes 2.O(7, 3) < GL(48, 3)$ (computing projectively)	$Sp(6, 3) \otimes 1$ or $1 \otimes 2.O(7, 3)$	645
$6.Suz < GL(12, 25)$	central 2	227
$S_{100}$	$A_{100}$	165
$A_{100}$	—	148
$PSL(10, 5)$	—	1248
$PGL(10, 5)$	$PSL(10, 5)$	1260

(here we have averaged over 10 runs, times in ms)

# Examples

This approach works well in many important cases:

$G$	$N$	time
$A_{20} \wr A_{30}$	$A_5^{\times 30}$	120
$SL(3, 3) \wr A_{10} < GL(30, 3)$	$SL(3, 3)^{\times 10}$	724
$Sp(6, 3) \otimes 2.O(7, 3) < GL(48, 3)$ (computing projectively)	$Sp(6, 3) \otimes 1$ or $1 \otimes 2.O(7, 3)$	645
$6.Suz < GL(12, 25)$	central 2	227
$S_{100}$	$A_{100}$	165
$A_{100}$	—	148
$PSL(10, 5)$	—	1248
$PGL(10, 5)$	$PSL(10, 5)$	1260

(here we have averaged over 10 runs, times in ms)

The success rate was 100% in all cases (using 200 runs).

# Reductions for imprimitive matrix groups

## Situation

Let  $G \leq \mathrm{GL}_n(\mathbb{F}_q)$  acting linearly on  $V := \mathbb{F}_q^{1 \times n}$ , such that  $V$  is **absolutely irreducible**. Assume there is  $N$  with  $Z(G) < N \triangleleft G$  such that

$$V|_N = W_1 \oplus W_2 \oplus \cdots \oplus W_k,$$

all  $W_i$  are **invariant under  $N$** , and  $G$  permutes the  $W_i$  transitively. Then there is a **homomorphism**  $\varphi : G \rightarrow S_k$ .

# Reductions for imprimitive matrix groups

## Situation

Let  $G \leq \text{GL}_n(\mathbb{F}_q)$  acting linearly on  $V := \mathbb{F}_q^{1 \times n}$ , such that  $V$  is **absolutely irreducible**. Assume there is  $N$  with  $Z(G) < N \triangleleft G$  such that

$$V|_N = W_1 \oplus W_2 \oplus \cdots \oplus W_k,$$

all  $W_i$  are **invariant under  $N$** , and  $G$  permutes the  $W_i$  transitively. Then there is a **homomorphism**  $\varphi : G \rightarrow S_k$ .

We use Algorithm `FINDELMOFEVENNORMALSUBGROUP`, for the result  $x$ , do:

- compute the **normal closure**  $M := \langle x^G \rangle$ ,
- use the **MeatAxe** to check whether  $V|_M$  is reducible,
- if  $x \in N$ , we find a reduction.

What can go  
wrong?

# What can go wrong?

Actually, **lots of things!**

- We could have **trouble** to find **elements of even order**.

# What can go wrong?

Actually, **lots of things!**

- We could have **trouble** to find **elements of even order**.
- An **order computation** could take **unpleasantly long**.

# What can go wrong?

Actually, **lots of things!**

- We could have **trouble** to find **elements of even order**.
- An **order computation** could take **unpleasantly long**.
- There could be **no non-central involutions**.

# What can go wrong?

Actually, **lots of things!**

- We could have **trouble** to find **elements of even order**.
- An **order computation** could take **unpleasantly long**.
- There could be **no non-central involutions**.
- There could be **extremely many central involutions**.
