## LieAlgDB: A database of nilpotent Lie algebras (with Willem de Graaf)

- ▶ Solvable of dimension at most 4  
(AllSolvableLieAlgebras)
- ▶ Non-solvable of dimension at most 6 over FF  
(AllNonSolvableLieAlgebras);
- ▶ Nilpotent of dimension at most 6 over odd characteristic  
(AllNilpotentLieAlgebras);
- ▶ Nilpotent of dimension at most 9 over  $\mathbf{F}_2$ ; at most 7 over  $\mathbf{F}_3$  and  $\mathbf{F}_5$   
(AllNilpotentLieAlgebras);
- ▶ Simple of dimension at most 9 over  $\mathbf{F}_2$   
(AllSimpleLieAlgebras);

# Immediate descendants and the cover

Suppose  $L$  is a nilpotent Lie algebra of class  $c$ .

The **cover**: The is a largest central extension

$$0 \rightarrow M \rightarrow L^* \rightarrow L \rightarrow 0.$$

$M$  is called the **multiplicator** and  $\gamma_{c+1}(L^*)$  is the **nucleus**.

If  $\bar{L}$  is a central extension of  $L$  then  $\bar{L} \cong L^*/U$  where  
 $U \leqslant M$ .

$\bar{L}$  is an immediate descendant if and only if  $U \neq M$  and  
 $U + \gamma_{c+1}(L^*) = M$ . Such a  $U$  is called **allowable**.

# Another trick

**Task:** Find all step-2 descendants of 7-dim abelian.

Need to determine the orbits of  $\mathrm{GL}(7, 2)$  on the set of 2 dimensional subspaces acting on  $\mathbf{F}_2^7 \wedge \mathbf{F}_2^7 \cong \mathbf{F}_2^{21}$ .

There are 733,006,703,275 subspaces.

The number of orbits can be found using the  
**Cauchy-Frobenius Lemma:**

$$\#\text{orbits} = \frac{1}{|G|} \sum_{g \in G} \text{fix } g = 20.$$

Using the list of groups with order  $2^9$  we can find 20 Lie algebras.

# The classification of soluble Lie algebras of dimension at most 4

## Theorem (Willem '05)

*The number of soluble Lie algebras of dimension 3 over  $\mathbf{F}_q$  is  $q + 5$  if  $\text{char } \mathbf{F}_q \neq 2$  and  $q + 4$  otherwise.*

*The number of soluble Lie algebras of dimension 4 over  $\mathbf{F}_q$  is*

$$q^2 + 3q + 9 + \begin{cases} 5 & \text{if } q \equiv 1 \pmod{6} \\ 2 & \text{if } q \equiv 2 \pmod{6} \\ 3 & \text{if } q \equiv 3 \pmod{6} \\ 4 & \text{if } q \equiv 4 \pmod{6} \\ 3 & \text{if } q \equiv 5 \pmod{6}. \end{cases}$$

## Theorem (Strade)

Over a finite field  $\mathbf{F}_q$ , the number of nonsolvable Lie algebras

- (iii) of dimension 3 is 1;
- (iv) of dimension 4 over char 2 is 2; over odd char it is 1;
- (v) of dimension 5 is 5, 4, 3 over char 2, [3 and 5], and  $\geq 7$ , respectively;
- (vi) of dimension 6 is  $14 + 2q$ ,  $13 + (5/3)q + \varepsilon$ ,  $13 + q$ ,  $11 + q$  over fields of characteristic 2, 3, 5, and  $\geq 7$ .

# Storing nilpotent Lie algebras

The package contains about 30000 nilpotent Lie algebras.

Every such algebra is encoded:

Let  $L = \langle x_1, \dots, x_d \rangle$  be such an algebra over  $\mathbb{F}_p$ . Then

$$[x_i, x_j] = \sum_{k=j+1}^d \alpha_{i,j}^k x_d \quad \text{for } i < j.$$

Write down the  $\alpha_{i,j}^d$  in a certain order and consider it as a number in base  $p$ . Convert this number to base 62 using the digits,  $0, \dots, 9, a, \dots, z, A, \dots, Z$ .

These strings are stored in the global variables  
`_liealgdb_nilpotent_d*f*`.

nilpotent Lie  
algebras

Csaba Schneider

## Sophus

- (i) more computations over extension fields;
- (ii) better automorphism group and isomorphism testing.

## LieAlgDB

- (i) 6-dim nilpotent over characteristic 2;
- (ii) check Strade's classification;
- (iii) add more classes of algebras.
